**SUBJECT:** **Carneros Vintners, Sonoma County, CA**  
**Greenhouse Gas Emissions Analysis – I&R #21-009**

Dear Tammy:

This letter presents the evaluation of greenhouse gas (GHG) emissions associated with the proposed expansion of the Carneros Vintners facility at 4200 Stage Gulch Road in Sonoma County. The project is located in the portion of the Bay Area where air quality is regulated by the Bay Area Air Quality Management District (BAAQMD).

### **Project Description**

Carneros Vintners received an approved Use Permit in April 2007 (PLP02-0085) with an annual production capacity of 250,000 cases of wine, public tastings, a 52,000 square foot (sf) winery facility, a 4,200-sf hospitality building (existing barn reconstruction), and 1,260 sf office/tasting building (existing house conversion). The 52,000-sf winery building was constructed and is currently producing 250,000 cases of wine for custom crush customers. The Phase II public tasting has never been implemented. The proposed Use Permit Modification seeks to allow additional grape crushing and wine production as a bulk wine/custom crush service of up to 2.5 million cases and eliminate the public tours and tastings uses approved with the current winery Use Permit.

GHG emissions associated with the winery use were computed for three scenarios:

1. Existing operations that produces 250,000 cases per year (Existing);
2. Full operation under the approved Use Permit that produces 250,000 cases per year plus a hospitality component (Permitted); and
3. Full operation of the proposed Use Permit that would produce up to 2,500,000 cases per year with no hospitality component (Proposed).

The increase in production would be accommodated within the existing 52,000-sf winery building and within a proposed new 22,000 sf production building. Due to the elimination of public tours, the 1,260-sf office/tasting room will be eliminated. The existing 4,250-sf barn will remain as

winery storage but will not include any hospitality use.

## **Setting and Regulatory Background**

The project is located in the San Francisco Bay Area Air Basin. The Bay Area Air Quality Management District's (BAAQMD) California Environmental Quality Act (CEQA) Air Quality Guidelines to assess air quality and GHG emissions from land use projects. This analysis was conducted following guidance provided by BAAQMD.<sup>1</sup>

Global temperatures are affected by naturally occurring and anthropogenic-generated (generated by humankind) atmospheric gases, such as water vapor, carbon dioxide, methane, and nitrous oxide. Gases that trap heat in the atmosphere are called GHGs. Solar radiation enters the earth's atmosphere from space, and a portion of the radiation is absorbed at the surface. The earth emits this radiation back toward space as infrared radiation. GHGs, which are mostly transparent to incoming solar radiation, are effective in absorbing infrared radiation and redirecting some of this back to the earth's surface. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This is known as the greenhouse effect.

The greenhouse effect helps maintain a habitable climate. Emissions of GHGs from human activities, such as electricity production, motor vehicle use and agriculture, are elevating the concentration of GHGs in the atmosphere, and are reported to have led to a trend of unnatural warming of the earth's natural climate, known as global warming or global climate change. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred because it implies that there are other consequences to the global climate in addition to rising temperatures. Other than water vapor, the primary GHGs contributing to global climate change include the following gases:

- CO<sub>2</sub>, primarily a byproduct of fuel combustion;
- Nitrous oxide (N<sub>2</sub>O), a byproduct of fuel combustion; also associated with agricultural operations such as the fertilization of crops;
- Methane (CH<sub>4</sub>), commonly created by off-gassing from agricultural practices (e.g. livestock), wastewater treatment and landfill operations;
- Chlorofluorocarbons (CFCs) were used as refrigerants, propellants and cleaning solvents, but their production has been mostly prohibited by international treaty;
- Hydrofluorocarbons (HFCs) are now widely used as a substitute for chlorofluorocarbons in refrigeration and cooling; and
- Perfluorocarbons (PFCs) and sulfur hexafluoride (SF<sub>6</sub>) emissions are commonly created by industries such as aluminum production and semiconductor manufacturing.

These gases vary considerably in terms of Global Warming Potential (GWP), a term developed to compare the propensity of each GHG to trap heat in the atmosphere relative to another GHG. GWP is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation

---

<sup>1</sup> BAAQMD, 2017. *BAAQMD CEQA Air Quality Guidelines*. May.

and the length of time of gas remains in the atmosphere. The GWP of each GHG is measured relative to CO<sub>2</sub>. Accordingly, GHG emissions are typically measured and reported in terms of equivalent CO<sub>2</sub> (CO<sub>2</sub>e). For instance, SF<sub>6</sub> is 22,800 times more intense in terms of global climate change contribution than CO<sub>2</sub>.

The State of California is addressing the issue of GHG through legislation, policy guidance, and outreach programs. CO<sub>2</sub> is the primary GHG emitted from land use and industrial projects. In 2006 California enacted AB 32 – the Global Warming Solutions Act, which requires that statewide GHG emissions be reduced to 1990 levels by 2020. In 2008, the California Air Resources Board (CARB) adopted the Climate Change Scoping Plan in response to AB 32. This plan describes the strategies that the State will implement to reduce future emissions by 28% to meet the 1990 target goal in 2020. BAAQMD's analysis of future land use development in the Bay Area and applicable AB 32 GHG reduction strategies lead to the development of emission-based significance thresholds for the projects in the Bay Area, which are also used in Sonoma County.

### Climate Action 2020 and Beyond – Sonoma County Regional Climate Action Plan

Climate Action 2020 and Beyond is a regional climate action plan (CAP) established by Sonoma County to reduce GHG emissions.<sup>2</sup> The CAP was published in July 2016. According to the County CAP, the county emitted approximately 3,944,000 MT CO<sub>2</sub>e in the year 2010. This countywide inventory identified that 53 percent of the emissions were due to on-road transportation, 34 percent came from building energy, 7 percent came from fertilizer and livestock, 4 percent came from solid waste, 2 percent came from off-road transportation and equipment, and less than one percent was due to wastewater treatment and water conveyance. Transportation and building energy are the biggest GHG emissions sources in Sonoma County.

The CAP includes measures to reduce GHG emissions by 25 percent below 1990 levels by 2020, which is the primary goal. The CAP's long-term goals include to reduce GHG emissions by 40 percent in 2030 and by 80 percent in 2050. The CAP includes goals and GHG reduction measures for six different GHG sources. Additionally, the CAP includes per capita targets to assess whether the long-term goals are being met. The 2020 County Target is 5.8 MT CO<sub>2</sub>e per capita, while the 2040 and 2050 targets are 2.6 and 1.3 MT CO<sub>2</sub>e per capita, respectively. The CAP also includes a consistency checklist listed as *Appendix A Climate Action 2020 Community Climate Action Plan Consistency Checklist Template* as a tool for local agencies to evaluate consistency with the CAP.<sup>3</sup> However, this CAP is not a valid CAP, and therefore not used for CEQA purposes.<sup>4</sup>

### BAAQMD CEQA Thresholds

The BAAQMD Air Quality CEQA Guidelines include a bright-line emissions threshold of 1,100 metric tons (MT) of CO<sub>2</sub>e or an emission efficiency metric of 4.6 MT of CO<sub>2</sub>e per year per service population (future residences and full-time workers) if the bright-line threshold is exceeded. Projects that have emissions below 1,100 MT of CO<sub>2</sub>e per year, or 4.6 MT of CO<sub>2</sub>e per year per

<sup>2</sup> Sonoma County Regional Climate Protection Authority, 2016. *Climate Action 2020 and Beyond*. July. Web: [https://rcpa.ca.gov/wp-content/uploads/2016/07/CA2020\\_Plan\\_7-7-16\\_web.pdf](https://rcpa.ca.gov/wp-content/uploads/2016/07/CA2020_Plan_7-7-16_web.pdf)

<sup>3</sup> Sonoma County Regional Climate Protection Authority, 2016. *Climate Action 2020 and Beyond Appendices*. July. Web: [https://rcpa.ca.gov/wp-content/uploads/2016/07/CA2020\\_Appendices\\_7-7-16\\_web.pdf](https://rcpa.ca.gov/wp-content/uploads/2016/07/CA2020_Appendices_7-7-16_web.pdf)

<sup>4</sup> Sonoma County, 2018. *Resolution Number 18-0166*. May.

capita, are considered to have less-than-significant GHG emissions. For this analysis, only the metric ton threshold of 1,100 MT of CO<sub>2</sub>e per year would apply.

## **Project Emissions**

GHG emissions are based on the CalEEMod modeling. The California Emissions Estimator Model, Version 2016.3.2 (CalEEMod) was used to estimate construction and operational emissions. CalEEMod is a computer model developed by the South Coast Air Quality Management District with cooperation of other California Air Districts to estimate air pollutant and GHG emissions from land use development projects. The model is recommended by BAAQMD for use in estimating emissions from land use development projects. The model accounts for emissions from construction equipment and traffic during construction and traffic, energy usage, water usage, solid waste generation, stationary equipment (i.e., boilers) and off-road equipment (i.e., forklifts).

### Construction Emissions

Construction emissions were based on model CalEEMod default conditions for construction of a 22,000-sf manufacturing building and about 0.66 acre of asphalt surfaces. Construction period GHG emissions are predicted to be 283 metric tons (MT). There are no construction GHG emissions thresholds to compare project construction GHG emissions against.

### Operational Emissions

Project operational emissions of carbon dioxide would result from a combination of traffic, energy usage, water usage, solid waste generation and combustion equipment. Biogenic emissions would be generated by fermentation of grapes to make wine; however, these are considered biogenic and not included in the project total emissions. CalEEMod was used to model direct and indirect land use emissions caused by the project. Annual GHG emissions were computed for the Existing, Permitted, and Proposed operation conditions.

#### *CalEEMod Modeling*

CalEEMod was used to estimate full build-out operational GHG emissions. Unless otherwise noted below, the model defaults for the Sonoma County – San Francisco Bay Area were used. The year 2023 was used for modeling, as this was assumed to be the earliest the project could be fully operational. Annual emissions occurring after 2023 would be lower as vehicle and electricity production emission rates are anticipated to continually decrease.

#### *Operational Trip Emissions*

Forecasted project trip generation rates provided by the traffic consultant were applied to the wine tasting room land use.<sup>5</sup> However, the trip generation rates were adjusted to the project land uses and broken down by passenger trips and truck trips. Passenger trips were assumed to be made up of light-duty automobile, light-duty trucks, and medium-duty vehicle classes. Truck traffic was assumed to be made up of medium heavy-duty and heavy heavy-duty trucks. CalEEMod default

---

<sup>5</sup> W-Trans, 2019. *Traffic Study for the Carneros Vintners Winery Use Permit Modification*. July.

trip lengths were used.

#### *EMFAC2017 Adjustment*

The CalEEMod model uses mobile emission factors from the California Air Resources Board's older EMission FACTors (EMFAC) 2014 model. EMFAC2017 became available for use in March 2018 and approved by the EPA in August 2019. It includes the latest data on California's car and truck fleets and travel activity. Additionally, CARB has recently released EMFAC off-model adjustment factors to account for the Safer Affordable Efficient (SAFE) Vehicle Rule Part one.<sup>6,7</sup> The SAFE vehicle Rule Part One revoked California's authority to set its own GHG emission standards and set zero emission vehicle mandates in California. As a result of this ruling, mobile criteria pollutant and GHG emissions would increase. Therefore, the CalEEMod vehicle emission factors and fleet mix were updated with the emission rates and fleet mix from EMFAC2017, which were adjusted with the CARB EMFAC off-model adjustment factors. More details about the updates in emissions calculation methodologies and data are available in the EMFAC2017 Technical Support Document.<sup>8</sup>

#### *Energy, Natural Gas, and Solid Waste Production*

CalEEMod defaults for energy use were overwritten using projected electricity usage for each modeled condition. The model has a default intensity rate of 641.3 pounds of CO<sub>2</sub> per megawatt of electricity produced, which is based on the Pacific, Gas and Electric Company's (PG&E) 2008 emissions rate. However, the project acquires electricity from Sonoma Clean Energy, which has a rate of 98 pounds CO<sub>2</sub> per megawatt of electricity delivered in the year 2018.<sup>9</sup>

Default model assumptions for emissions associated with solid waste generation use were applied to the project.

#### *Water Usage*

Water/wastewater use estimates were entered into CalEEMod along with the types of treatment that would occur. Domestic wastewater would be treated through septic systems while winery waste water would be treated using facultative lagoons and spray fields.

#### *Natural Gas*

A 4.5-mBtu rated boiler is currently used for 10 hours per week for 2 months or 8 weeks per year. This boiler was accounted for as "Stationary Equipment" in CalEEMod.

<sup>9</sup> SCE, 2021. Website: <https://sonomacleanpower.org/power-sources> Accessed 1/29/2021.

### *Off-Road Equipment*

The facility currently operates 8 forklifts about 4 hours per day. That activity is assumed to remain under permitted conditions. Under the Proposed conditions, there would be 12 forklifts. These were accounted as “Off-Road Equipment” in CalEEMod. A 5,000-pound forklift using CNG was assumed that is rated at 60 horsepower.

### Wine Fermentation

The emissions calculations do not include biogenic emissions such as wine fermentation. These emissions are considered part of the natural carbon cycle associated with grape growing that does not occur at the Project site.

### Summary of Operational Criteria Pollutants and GHG Emissions

Table 1 presents the results of this assessment. BAAQMD does not provide any guidance for assessing emissions from wineries, other than use of CalEEMod. The wine industry considers fermentation emissions to be biogenic and part of the natural carbon cycle associated with farming of grapes. Farming of grapes does not occur as part of the proposed project.

**Table 1. Annual Operational GHG Emissions (MT CO<sub>2</sub>e/Year)**

Source	Existing	Permitted	Proposed	Methodology
Area	0	0	0	Based on CalEEMod default
Energy Consumption	4	4	5	Based on electricity only of 80,000 kW/yr for existing and permitted and 120,000 kW for Proposed, adjusted to SCE verified intensity rate for electricity
Mobile	27	113	312	CalEEMod modified with EMFAC2017 using projected daily traffic generation broken down by cars and trucks.
Off Road Equipment	48	48	72	CalEEMod for 5000-lb forklift using CNG. 8 forklifts for Existing and Permitted and 12 forklifts for Proposed
Stationary Equipment	27	27	37	Based on CalEEMod for 4.5 MBTU-rated boiler 10 hrs/week for 8 weeks
Water and wastewater	11	11	58	Based on CalEEMod using estimated domestic flow for septic system and winery flow for lagoons/spray fields
Solid Waste	27	27	37	Based on CalEEMod default
<b>Project Total</b>	<b>120</b>	<b>206</b>	<b>488</b>	
<b>Increase over existing</b>			<b>368</b>	
<b>Increase over permitted</b>			<b>282</b>	
<b>BAAQMD Threshold</b>			<b>1,100 MT CO<sub>2</sub>e/Year</b>	
<b>Exceed Threshold?</b>			<b>No</b>	

This concludes our assessment of the GHG emissions from this project. If you have any questions or comments, please feel free to contact me at (707) 794-0400 x106. We appreciate the opportunity to assist you.

Sincerely,

James A. Reyff

## Caneros Vintners Proposed Project Operation - Sonoma-San Francisco County, Annual

**Caneros Vintners Proposed Project Operation**  
**Sonoma-San Francisco County, Annual**

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Refrigerated Warehouse-No Rail	78.25	1000sqft	1.80	78,250.00	0

### 1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	75
Climate Zone	4			Operational Year	2023
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	98.81	CH4 Intensity (lb/MWhr)	0	N2O Intensity (lb/MWhr)	0

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Sonoma Clean Energy

Land Use - Assume production is 52ksf+22ksf(new)+4.25ksf(barn storage) = 78.25ksf

Construction Phase - Operational run

Off-road Equipment - operational run

Vehicle Trips - Total = 115/78.25 = 1.47 trips/ksf

Energy Use - No natural gas (see boiler) and 120,000kw/hr electricity

Water And Wastewater - 6343700 total Domestic = 84,500 and wine prod = 6259200 gallons (1.3%)

Operational Off-Road Equipment - Assume 60hp for 5,000lb forklift

Fleet Mix - Based on traffic study for proposed = 56% trucks (MHD&HHD) and 44% LDA/LDT (LDA,LDT2,MDV)

Stationary Sources - Process Boilers - 4.5mbtu boiler 10hrs/week for 8 weeks

## 11.0 Vegetation

---

## Caneros Vintners Permitted Project Operation - Sonoma-San Francisco County, Annual

**Caneros Vintners Permitted Project Operation**  
**Sonoma-San Francisco County, Annual**

**1.0 Project Characteristics****1.1 Land Usage**

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	52.00	1000sqft	1.19	52,000.00	0
Quality Restaurant	4.46	1000sqft	0.10	4,460.00	0

**1.2 Other Project Characteristics**

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	75
Climate Zone	4			Operational Year	2023
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	98.81	CH4 Intensity (lb/MWhr)	0	N2O Intensity (lb/MWhr)	0

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics - Soonoima Clean Energy

Land Use - Best fit of permitted uses to CalEEMod uses

Construction Phase - Operational run

Off-road Equipment - operational run

Vehicle Trips - Total = 91 daily with all traffic assigned to tasting (Restaurant) 72/4.46 or 16.15 and trucks assigned to 52ksf building 19/52=0.37/ksf

Energy Use - No natural gas (see boiler) Electricity based on 80,000 kw/yr

Water And Wastewater - Based on water/wastewater provided for domestic (septic) and industrial (lagoon)

Operational Off-Road Equipment - HP for 5,000lb gas

Fleet Mix - Only trucks assigned to this land use

Stationary Sources - Process Boilers - 4.5mbtu Boiler 10hr/week for 8 weeks

**Sonoma-San Francisco County, Annual**

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	52.00	1000sqft	1.19	52,000.00	0
Quality Restaurant	4.46	1000sqft	0.10	4,460.00	0

### 1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	75
Climate Zone	4			Operational Year	2020
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	98.81	CH4 Intensity (lb/MWhr)	0	N2O Intensity (lb/MWhr)	0

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Sonoma Clean Energy

Land Use - Best fit of permitted uses to CalEEMod uses

Construction Phase - Operational run

Off-road Equipment - operational run

Vehicle Trips - Total = 48 daily with all traffic assigned to tasting (Restaurant) 45/4.46 or 10.09 and trucks assigned to 52ksf building 3/52=0.06/ksf

Energy Use - No natural gas (see boiler). Electricity usage = 80,000kw/year

Water And Wastewater - Water and Wastewater

Operational Off-Road Equipment - Reported 8 forklifts = 60hp for 5000lb gas

Fleet Mix - Only trucks assigned to this land use

Stationary Sources - Process Boilers - 4.5mbtu boiler 10hr/week for 8 weeks

EMFAC2017 (v1.0.2) Emission Rates

Region Type: Cour

Region: SONOMA

Calendar Year: 2023

Vehicle Classification: FIA F3 2007 Category

Vehicle Classification: EMR-AL200 Categories: Units: miles/day for VMT, trips/day for Trips, g/mile for RUNEX, PMBW and PMTW, g/trip for STREX, HTSK and RUNLS, g/vehicle/day for IDLEX, RESTL and DIURN. Note 'day' in the unit is operation day.

Adjustment Factors for EMFAC2017 Gasoline Light Duty Vehicles					
Year	NOx Exhaust	TOG Evaporative	TOG Exhaust	PM Exhaust	CO Exhaust

\*PM Exhaust off model factor is only applied to the PM Exhaust emissions not start/idle

The off-model adjustment factors need to be applied only to emissions from gasoline light duty vehicles (LDA, LDT1, LDT2 and MDV). Please note that the adjustment factors are by calendar year and includes all model years.

Enter NA in the date field if adjustments do not apply
