LEGEND

 Tree Preservation Zones, as feasible per arborist report

 Heritage Trees to Remain

Sonoma Developmental Center Arborist Report

PREFACE

This report assesses tree conditions on the SDC core development site and reviews an arborist report prepared for the California Department of General Services. Recommendations are provided for a tree management program for trees designated for preservation. This report was prepared at the request of Eldridge Renewal, LLC, developers of the Sonoma Development Center project.

James MacNair, principal of MacNair and Associates, ISA Certified Arborist WE-0603A, ISA Tree Risk Assessment Qualified, and ASCA Tree and Plant Appraisal Qualified, prepared this evaluation and report.

February 2, 2024

Unless expressed otherwise, the information in this report covers only those items that were examined and reflects the condition of those items at the time of inspection. The inspection is limited to visually examining accessible items without dissection, excavation, probing, or coring. There is no warranty or guarantee, expressed or implied, that problems or deficiencies of the trees in question may not arise in the future.

Assignment:

This report was prepared at the request of Eldridge Renewal, LLC, developers of the Sonoma Development Center project.

The purpose of this evaluation is to:

- Provide descriptions of predominant vegetation and existing conditions on the site and within the development area (Core Area).
- Review the existing tree database and arborist reports for completeness and accuracy.
- Establish criteria for assessing trees for suitability for preservation, including health, structure, species tolerance to construction impacts, and risk assessments.
- Review the project's conceptual design plans for anticipating probable tree construction impacts.
- Prepare tree protection specifications for protecting trees designated for preservation.

Background Information:

The following arborist reports and tree data were reviewed and field verified.

- ECORP Consulting Inc., Arborist Survey and Report dated May 2021 and prepared for the California Department of General Services. This report inventoried 612 trees within the Core Area, including GPS waypoint locations and health and structure ratings. The Inventory focused on trees near structures and roadways. Limited management recommendations were included but did not include formal risk assessments.
- Horticultural Associates, Tree Pruning Recommendations report dated November 27, 2023, and prepared for Plant Operations Sonoma Development Center. This report specifically addressed the trees located along Arnold Drive. It provides tree pruning and removal recommendations to address ongoing tree risks due to a history of frequent limb failures on Arnold Drive and the adjacent sidewalks.

Existing Conditions:

The vegetation zones in the project area include:

- The ornamental tree plantings in the Core Area consist of street tree plantings and trees installed around the facility buildings. The age of the trees is likely from 40 to 80 years, with certain trees being 100 years or more.
- Riparian zones, including Sonoma Creek and associated drainage tributaries traversing the site. The riparian zones are all designated for protection. The critical issues are the condition of trees at the riparian and core area interface, where the trees require structural assessments to mitigate risk issues that could impact high-use areas. A part of this interface assessment is the evaluation of trees damaged by the 2017 wildfires.

French broom was also observed in the riparian zone and is recommended for eradication.

- The oak woodland areas are primarily located on the core boundary limits' west, southwest, and northeast perimeters. There is also a woodland zone in a sloped area below the western corner of structures in the core area. These areas require implementing defensible zone procedures for wildfire safety and removing non-native trees and invasive species.

Tree Species Discussion:

An analysis of the ECORP tree data for 612 trees shows that the tree population consists of 51 species. Ten species make up 68% of the total Inventory. The following table lists these trees and quantities.

Table 1- Listing of the Primary Tree Species.

Common Name	Botanical Name	Protected Species	Quantity	% of Total
ash	<i>Fraxinus spp.</i>	no	43	7%
California bay laurel	<i>Umbellularia californica</i>	yes	17	2%
coast live oak	<i>Quercus agrifolia</i>	yes	25	4%
coast redwood	<i>Sequoia sempervirens</i>	yes	40	6.5%
Eastern red oak	<i>Quercus spp.</i>	no	88	14%
elm	<i>Ulmus spp.</i>	no	29	5%
liquidambar	<i>Liquidambar styraciflua</i>	no	18	2%
London plane tree (sycamore)	<i>Platanus x hispanica</i>	no	27	4.5%
pinus	<i>Pinus spp.</i>	no	21	3.5%
valley oak	<i>Quercus lobata</i>	yes	110	18%
		Totals:	418	68%

Further, when examining the rating statistics of these ten species, there are significant health and structural issues. The following tables show the health and structural ratings for the ten tree species.

Table 2- Listing of the Primary Tree Species and Health Ratings.

Common Name	Dead	Poor	Poor to Fair	Fair	Fair to Good	Good	Total
ash	1	9	5	24	4	0	43
California bay laurel	2	1	4	5	5	0	17
coast live oak	6	0	6	7	5	1	25
coast redwood	14	7	10	7	2	0	40
Eastern red oak	9	7	43	26	3	0	88
elm	0	0	6	21	2	0	29
liquidambar	0	0	3	11	4	0	18

Common Name	Dead	Poor	Poor to Fair	Fair	Fair to Good	Good	Total
London plane tree (sycamore)	1	0	2	18	6	0	27
pinus	9	1	5	5	1	0	21
valley oak	5	7	32	63	2	1	110

Table 3- Listing of the Primary Tree Species and Structural Ratings.

Common Name	Poor	Poor to Fair	Fair	Fair to Good	Good	Total
ash	11	2	25	5	0	43
California bay laurel	5	3	6	3	0	17
coast live oak	6	2	15	2	0	25
coast redwood	19	8	10	2	1	40
Eastern red oak	19	26	36	5	2	88
elm	0	10	18	1	0	29
liquidambar	1	4	7	5	1	18
London plane tree (sycamore)	1	3	22	1	0	27
pinus	10	6	5	0	0	21
valley oak	13	31	60	5	1	110

The health ratings for the 612 trees reveal 72 dead trees, 72 in poor condition, and 174 in poor to fair condition. This amounts to 52% of all of the trees. The rating of "poor to fair" indicates trees in marginal health with significant crown decline and pest or disease problems. The structural ratings for the 612 trees are 157 trees in poor condition and 153 trees in poor to fair condition, or 51% of the total number.

The reasons for the poor to marginal conditions of the trees are a combination of issues. First, the age of the trees is important; many of these species are near the end of their useful life with lower vigor and resistance to problems with decay and pests. The prolonged drought and the cessation of regular irrigation have significantly impacted the more water-dependent species, such as redwoods and the Eastern red oaks, which are particularly susceptible. Trees like ash, liquidambar, and pines are especially vulnerable to drought stress. These species also become more prone to limb failures as they mature.

There has also been a lapse in tree maintenance at the SDC in the last decade. For example, the Eastern red oaks along Arnold Drive have been a significant risk to traffic due to frequent large-diameter limb failures, mainly due to mistletoe infections. Generally, there has been minimal tree maintenance since the center's closure.

Fire damage from the 2017 wildfires has also damaged trees in the Sonoma Creek riparian zone, with trees still collapsing from the damage to lower trunks.

Recommendations:

The following are recommendations for determining the trees suitable for preservation based on the condition of the individual tree and location relative to the proposed site improvements.

1. Determine the probable grading limits of the project to determine which trees and areas can potentially be preserved.
2. Complete the survey of trees not included in the ECORP inventory.
3. Update the tree condition assessments and identify trees suitable for preservation.
4. The rating for suitability for preservation is based on the condition of the tree (health and structure) and the species' tolerance for root loss. Trees selected for preservation should be carefully evaluated to justify the preservation cost and ensure their viability and ability to provide long-term benefits to the new community.
5. A detailed tree protection plan should be prepared to protect trees designated for preservation.
6. Trees currently near high-use areas are recommended for formal risk assessments.
7. The trees in the riparian zone and core area interface require assessment for fire damage and structural stability. Additionally, areas with invasive plant infestations should be mapped, and an eradication plan should be prepared.
8. Woodland zones require an assessment to establish wildfire-defensible space requirements at the woodland interface with the core development area.

Appendix A

Site and Tree Images

East perimeter of the core boundary area with established Coulter pine and coast live oak.

Linear planting of coast redwoods, pines, and eucalyptus in future development area.

Coast live oak going amongst coast redwoods and planted pines.

Mature valley oaks growing in riparian transition zone.

Typical mixed plantings of various tree species in a western section of the core area.

A fire-damaged riparian zone next to the core development area.

A recent failure of a coast live oak due to an attachment defect. French broom is also established in this area (arrow).

Fire damaged valley oak at the riparian core area interface.

Mature ash trees in decline. Arrow indicated mistletoe infections.

Mature liquidambar in marginal condition at edge of the core area.

Mature coast redwoods with one of trees in advanced decline likely due to drought stress.

Mature London plane tree (sycamore) in generally good condition.

Planting of mature Eastern red oaks in marginal condition due to drought stress and mistletoe infections.

Valley oaks with variable forms and vigor growing in lawn area.

Area near the Ecology Center with Coulter pines declining due to Diplodia shoot blight infection.

Eastern red oaks planted along Arnold Drive. These trees have been gradual decline with frequent large-diameter limb failures.

Young red oak was planted as a replacement for a tree that had died or had a major structural failure.

Heavily pruned red oak due to limb dieback.

2/2/24

A liquidambar with branch dieback from drought stress but now improving with recent normal winter rainfall.

The blue oak woodland interface on the west side of the core development area. The planted Deodar cedars are inappropriate due to their pyrophytic status (trees that ignite quickly and burn intensely).

Mature California fan palms. They could possibly be transplanted to replace the palms removed in the green in front of the original administration building.

The pollarded plane trees in front of the historic administration building.

The dense stand of mature trees in the lawn area south of the administration building.

Mature street trees in the core area.

A mature valley oak that has adapted to limited root area. The Monterey pine to the left has a serious co-dominant trunk defect and significant limb dieback occurring likely from bark beetles.

Appendix B

Tree Protection Specifications

2/2/24

Development of the project infrastructure, including roads, utilities, drainage facilities, etc., will alter the natural terrain and affect existing trees growing close to the construction areas. Impacts will primarily occur due to the site grading requirements and underground utility installations. The following procedures are recommended to maximize tree survivability.

1. Tree Protection Zone and Critical Root Zone

- 1.1. All construction activity (grading, filling, paving, landscaping) will respect a Tree Protection Zone (TPZ) around trees to be protected. The TPZ will typically be a one-foot radial distance from the trunk for each one-inch diameter. Exceptions to this standard may occur depending upon individual trees' age, condition, and species tolerance. The Critical Root Zone is the radial area around the trunk where all root impacts should be avoided or mitigated with specialized procedures. Typically, the critical root zone will be a radial distance equal to three times (3X) the trunk diameter.

2. Construction Observations and Supervision

- 2.1. All arboricultural and related soil work should be performed under the observation of an International Society of Arboriculture (ISA) Certified Arborist (Supervising Arborist) or Client designated representative.
- 2.2. All specified arboricultural work should be completed before site grading (root pruning, crown pruning, fencing, etc.)
- 2.3. The contractor is required to meet with the Supervising Arborist or Client designated representative to review the tree protection requirements, including work procedures, access routes, and storage areas.

3. Tree Protection Fencing

- 3.1. Fencing at a minimum of four feet in height and marked to prevent inadvertent encroachment by heavy machinery should be installed either at the edge of the Tree Protection Zone (TPZ), the crown drip line (whichever is further from the trunk), or at the edge of the construction zone, if the construction zone protrudes into the TPZ. The Supervising Arborist, or Client designated representative, should approve the location of the fencing. All fencing should be in place prior to any site grading. Fences may not be relocated or removed without the written permission of the Supervising Arborist or Client-designated representative.
- 3.2. Bilingual (English/Spanish) signage with a contact phone number shall be attached to the fencing in multiple locations with the following language:

**Tree Preservation Area
Entry Prohibited without Authorization by...**

- 3.3. Install trunk protection measures for trees within 10 feet of construction activities, which as a minimum shall include the installation of ½ in. closed cell foam padding around the trunk of each tree from soil grade to a height of 6 ft. above grade. 2" x 4" x 6' wood planks shall be installed on top of the padding and secured with metal straps in at least two locations. No

2/2/24

fasteners or other invasive hardware shall be driven into the protected trees. (This may not be applicable)

- 3.4. The contractor shall maintain the protection fencing and prohibit all access to fenced areas by construction personnel or equipment until all site work is completed.
- 3.5. All structures, including construction trailers, equipment storage areas, and other construction traffic, are prohibited in fenced areas. Burning or debris piles are prohibited within fenced areas. No materials, equipment, spoil, waste, or washout water should be deposited or stored within fenced areas. Fences may not be moved without written permission of the Supervising Arborist or Client designated representative.
- 3.6. If temporary access within a fenced area is necessary, then a six-inch layer of bark mulch or gravel should be placed in all areas requiring access. This requirement for mulching should apply to all areas within the fenced area and subject to access. If equipment access is required, the mulch should be overlaid with metal plates of sufficient thickness to distribute the bearing load adequately.

4. Demolition/Site Clearing

- 4.1. The following work must be accomplished before any demolition or site-clearing activity occurs within 50 feet of protected trees.
- 4.2. The demolition contractor must meet with the project arborist or designated client representative at the site before beginning work to review all work procedures, access and haul routes, and tree protection measures.
- 4.3. The limits of all tree protection zones shall be staked in the field.
- 4.4. Tree(s) to be removed with branches extending into the canopy of tree(s) to remain must be removed by a qualified arborist and not by demolition or construction contractors. The qualified arborist shall remove the tree in a manner that causes no damage to the tree(s) and the understory to remain.
- 4.5. Any brush clearing required within the tree protection zone shall be accomplished with hand-operated equipment.
- 4.6. Trees to be removed shall be felled to fall away from tree protection zones and to avoid pulling and breaking of roots of trees to remain. If roots are entwined, the consultant may require first severing the major woody root mass before extracting the trees. This may be accomplished by cutting through the roots by hand, with a vibrating knife, rock saw, narrow trencher with sharp blades, or other approved root-pruning equipment. [Note: If possible, show areas where root cutting is required on the demolition plan.]
- 4.7. A qualified arborist shall remove trees to be removed from within the tree protection zone. The trees shall be cut near ground level and the stump ground out.
- 4.8. All downed brush and trees shall be removed from the tree protection zone either by hand or with equipment set outside the tree protection zone. Extraction shall occur by lifting the material, not skidding it across the ground.
- 4.9. The brush shall be chipped and placed in the tree protection zone to a depth of 6 inches.

2/2/24

- 4.10. Structures and underground features to be removed within the tree protection zone shall use the smallest equipment possible and operate outside the tree protection zone. The consultant shall be on-site during all operations within the tree protection zone to monitor demolition activity.
- 4.11. All trees shall be pruned per the provided Pruning Specifications.
- 4.12. A 6-foot chainlink fence with posts sunk into the ground shall be erected to enclose the tree protection zone
- 4.13. Any damage to trees due to demolition activities shall be reported to the consulting arborist within 6 hours so that remedial action can be taken. Timeliness is critical to tree health.
- 4.14. If temporary haul or access roads must pass over the root area of trees to be retained, a roadbed of 6 inches of mulch or gravel shall be created to protect the soil. The road bed material shall be replenished as necessary to maintain a 6-inch depth.

5. Site Grading, Trenching, and Root Pruning

- 5.1. Keep site grading within designated construction zones. Grading cuts or trenching within the TPZ of a retained tree trunk requires special trenching procedures. Trenches should be dug manually with an air spade or using a root-cutting machine, rock cutter, or other approved root-pruning equipment. This root-pruning trench should be placed one foot inside the edge of the grading cut or trench edge. The depth of the trench should equal the depth of the grading cut to a maximum depth of 40 inches. All work expected to encounter roots must be monitored by the Supervising Arborist or Client designated representative.
- 5.2. A trench may be mechanically dug toward a tree until the edge of the TPZ is reached. Special trenching procedures shall apply from the edge of the TPZ.
- 5.3. Underground utilities, drains, and irrigation lines should be routed outside the TPZs. When lines must cross the TPZ, the lines should be bored or tunneled through the area at a depth approved by the supervising arborist. In these instances, a single shared utility conduit should be used to reduce impacts on trees.
- 5.4. Any roots one inch in diameter or larger requiring removal should be cut cleanly in sound tissue. The roots and surrounding soil should be moistened and covered with a thick mulch (4") to prevent desiccation. No pruning seals or paints should be used on wounds. Cut and exposed roots should be protected from drying. A water-absorbent material (i.e., burlap) should be secured at the top of the trench and draped over the exposed roots. This material should be kept moistened and soil replaced as soon as practicable.
- 5.5. Porous pavements are recommended for use within the TPZ. Construction of the pavement sub-base should avoid grading cuts where possible.

6. Site Drainage

- 6.1. All grading shall be designed to provide positive drainage away from the base of the tree trunk and not create ponding within the TPZ.

2/2/24

7. Pruning and Cabling

- 7.1. Any tree pruning, cabling, or other similar activity that may be proposed as part of site construction will be included on site plans and reviewed by a qualified arborist or Client-designated representative.
- 7.2. Pruning methods shall conform to the ANSI A 300-2001 Pruning Standard Practices and be performed by an ISA Certified Arborist or Certified Tree Worker. Cabling or other support systems shall conform to the ANSI A 300 (part 3)-2000 Standard Practices

8. Tree Damage Mitigation

- 8.1. Trees damaged or significantly impacted during construction shall be evaluated by the Supervising Arborist or Client designated representative. Proper mitigation measures shall be specified and may include:
- 8.2. Pruning of damaged and dead wood.
- 8.3. Installation of a drip irrigation system to provide supplemental irrigation for three to five seasons following damage.
- 8.4. Proper low nitrogen fertilization timed to growth response and phenological development of the tree.
- 8.5. Periodic risk assessment of tree.
- 8.6. Replacement of tree per client requirements.
- 8.7. Alleviation of severe compaction by vertical mulching with augers or hydraulic soil probes.
- 8.8. Alleviation of surface compaction by light cultivation or raking and mulch application.
